Infinite Agent

Proposed architecture for a general-purpose agent with function calling and relational database retrieval

Jev (purple)
Function and schema selection, information sufficiency, and relationship decisions

LLM (green)
Missing argument extraction, new SQL generation, and final answer generation

Code (gray)
Immediate acknowledgements, concurrency control, queues, validation, and accumulated request state

Additional messages and query results accumulate in the same active request. Required functions are selected without a count limit; only simultaneous queries are controlled by **max_concurrent_queries**. The accumulated request receives one combined final response.
